Overview

Pentaho can be configured to use many mechanisms for authentication and authorization, such as the lightweight directory access protocol (LDAP) or database-based authentication (JDBC authentication) from Microsoft Active Directory.

This document aims to work through the steps needed to set up Pentaho to authenticate using Integrated Windows Authentication (IWA) with a pre-configured Microsoft (MS) Active Directory.

The intention of this document is to speak about topics generally; however, these are the specific versions covered here:

<table>
<thead>
<tr>
<th>Software</th>
<th>Version(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pentaho</td>
<td>8.x</td>
</tr>
</tbody>
</table>

The Components Reference in Pentaho Documentation has a complete list of supported software and hardware.

Before You Begin

Before beginning, use the following information to prepare for the procedures described in the main section of the document.

Prerequisites

This document assumes that you have knowledge of Pentaho and have already installed it and configured it to authenticate using Microsoft Active Directory on MS Windows Server 2012 R2. More information on this is available in Configuring Pentaho with LDAP or Active Directory in the Security for Pentaho Best Practices.

Use Case: Single Sign-On

Janice administers an environment where users can access single sign-on (SSO) to use their Windows networking credentials to get into most web applications they use. She knows that unlike other authentication mechanisms, Integrated Windows Authentication does not prompt the user to enter a username and password to log into Pentaho through the web browser. Instead, the current Windows user authentication on the computer is passed to Pentaho through the web browser. In this way, if the user does not have access to Pentaho as configured in the Microsoft Active directory configuration for Pentaho, then the user will be prompted to enter his or her username and password.
Intro to Authentication and Authorization in Pentaho

To understand how to configure Pentaho to use a database-based authentication scheme, you will need to understand what authentication and authorization are in terms related to Pentaho. Pentaho uses the Spring Framework for authentication and authorization purposes.

Authentication happens when the user logs in. The user is checked for validity and activity before being able to log in.

Once the user is granted permission, we check the user’s roles to determine what the user is authorized to do in the server. The roles are assigned when the user's identity has been verified. Roles give the user operational permissions on the server, such as Manage Security, Schedule Content, and Manage Data Sources.

Keep in mind that a user may be able to open a report, but not allowed to see the contents; this is not to be confused with authorization. Being able to see the contents of a report is controlled through Mondrian roles in analyzer reports. These are security-constrained accesses and are beyond the scope of this document.
Installing and Configuring Tomcat IIS Connector

You can download the tomcat_iis_connector at Apache's site, and then configure it. You can find details on these topics in the following sections:

- Install Tomcat IIS Connector
- Configure Tomcat IIS Connector

Install Tomcat IIS Connector

The downloaded ZIP file contains the configuration files necessary for the Internet Server Application Programming Interface (ISAPI) filter to run and communicate with Pentaho's Tomcat.

1. Extract the downloaded zip file and place the contents in a convenient folder in your C:\ drive, such as C:\tomcat_iis_connector.
2. If you extracted the Apache JServ Protocol (AJP) Connector to a directory other than the default (C:\tomcat_iis_connector):
   a. Edit the isapi_redirect.properties file and make sure that the log_file, worker_file, worker_mount_file and rewrite_rule_file properties point to the correct locations.
3. Open /tomcat_iis_connector/conf/workers.properties.minimal and change the AJP port number to the port number you have configured in your /tomcat/conf/server.xml file.

   The AJP port is configured to 8009 in Pentaho's /tomcat/conf/server.xml. If you wish to use a different port number, make sure to change both files accordingly.

4. Make sure the following Windows accounts have full access to the C:\tomcat_iis_connector folder and to the folder where the Pentaho Server is installed:
   IIS_IUSRS
   IUSR

   IIS_IUSRS is a built-in security group, and IUSR is a built-in IIS account.

Configure Tomcat IIS Connector

To get the connector working, you must first set up a registry value for the tomcat_iis_connector:

1. Make sure you back up your registry.
2. Run regedit as a Windows administrator.
3. Find the key: HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Apache Software Foundation\ jakarta.isapi redirector
   a. Create one new key entry there called Jakarta Isapi Redirector.
   b. Create another new key entry named 1.0. Under this key, create six new string values as shown in this table:
4. Configure the following files if you have one or more Tomcat instances (workers):
   a. In C:\tomcat_iis_connector\conf\uriworkermap.properties, find the entry
      
      
   i. To enable more workers, add a worker2 there, using a comma-separated list.
      ii. Add more workers as needed.
   b. In C:\tomcat_iis_connector\conf\workers.properties, change the following entries according to your environment:
# The workers that jk should create and work with. You can add more workers accordingly

worker.list=worker1

# Defining a worker named worker1 and of type ajp13.
# Note that the name and the type do not have to match.
worker.worker1.host=localhost (ip address or dns name of the Pentaho Server)
worker.worker1.port=8009
worker.worker1.type=ajp13

#worker.worker1.port=8009 this port is configured in tomcat/conf/server.xml
Installation and Configuration of IIS Role

The following instructions may vary based on your installation of IIS. Below, you will find the instructions to get Pentaho working with IIS 8.5.

You can find details on these topics in the following sections:

- Add Server Roles
- Set Up ISAPI Filter on Web Server
- Set Up ISAPI and CGI Restrictions
- Create a Virtual Directory and Handler Mappings
- Enable Windows Authentication
- Configure IIS to Handle Special Characters

Add Server Roles

Here are the steps to add server roles:

1. Under the **Server Manager**, select the **Dashboard**.
2. Add a new **Server Role**.
3. Under **Roles**, select **Web Server (IIS)**.

![Add Roles and Features Wizard](image)

*Figure 2: Add Roles and Features Wizard*
4. Select **Application Development**, and then select **ISAPI Extensions** and **ISAPI Filters**.

![Add Roles and Features Wizard](image)

*Figure 3: Add Roles and Features Wizard*

5. Proceed to installation by clicking on **Next**, and then **Install**.

### Set Up ISAPI Filter on Web Server

Once installation is complete, open the IIS Manager. Follow these steps to set up an ISAPI filter on your web server.

1. Select your web server (**IIS Server**).
2. Click **ISAPI Filters**.
3. Under **Actions**, click **Add**.
4. There, enter the following:
   a. **Description**: `isapi_redirect`
   b. **Path**: Click the click on the ellipsis (…) button and search for the `isapi_redirect.dll.is(tomcat_connector)`.

5. Click **OK**.

### Set Up ISAPI and CGI Restrictions

Now, follow these steps for setting up ISAPI and CGI restrictions:

1. Select your server.
2. Open **ISAPI and CGI Restrictions** from the features view.

![ISAPI and CGI Restrictions](image1)

*Figure 4: ISAPI and CGI Restrictions*

3. For ISAPI or CGI path, click on the ellipsis (…) button and search for the `isapi_redirect.dll`.
4. In the description field, type `isapi_redirect`.

![Edit ISAPI or CGI Restriction](image2)

*Figure 5: Edit ISAPI or CGI Restriction*

**Create a Virtual Directory and Handler Mappings**

Follow these steps to create a virtual directory and handler mappings:

1. In **IIS Manager**, right-click on the default website and choose **Add Virtual Directory**.
2. Enter `jakarta` in the alias field and then choose the path of the `isapi_redirect.dll` as the physical path.
3. Click **OK** then select the **Jakarta** virtual directory.
4. From the **Features** view, double-click on **Handler Mappings**, and select **ISAPI-dll**.
5. From the **Actions** bar, select **Edit Features Permissions**, and make sure that **Read**, **Script**, and **Execute** are selected.
Enable Windows Authentication

Here are the steps for enabling Windows authentication:

1. On IIS Manager, select the default website.
2. Double-click on Authentication.
3. Make sure Anonymous Authentication is disabled.
4. Make sure Windows Authentication is enabled.

![Figure 8: Default Website Authentication](image)

5. On IIS Manager, select the Jakarta virtual directory.
7. Make sure Anonymous Authentication is disabled.
8. Make sure Windows Authentication is enabled.

![Figure 9: Jakarta Authentication](image)
Configure IIS to Handle Special Characters

Here are the steps to configure IIS to handle special characters:

1. Open IIS Manager.
2. Click on the default website.
3. Click on Actions, and then select Explore. It should open in the C:\inetpub\wwwroot folder where you will find the web.config file.
4. Add the following entry under <system.webServer>:

   <security>
   <requestFiltering allowDoubleEscaping="true"></requestFiltering>
   </security>

5. Add the following entry inside <system.webServer>:

   <system.web>
   <httpRuntime requestPathInvalidCharacters="" />
   </system.web>

6. Save the web.config.
7. Restart IIS on the default website.
Pentaho Configurations

This section contains the configuration steps for your Pentaho installation. You can find details on these topics in the following sections:

- Set tomcatAuthentication to False
- Enable preAuthenticatedProcessingFilter
- Configure authenticationManager
- Configure preAuthenticatedProcessingFilter
- Configure preAuthenticationProvider
- Configure exceptionTranslationFilter
- Configure exceptionTranslationFilterForWS

Set Tomcat Authentication to False

Follow these steps to set tomcatAuthentication to False:

1. Locate the following file: Pentaho-server/tomcat/conf/server.xml
2. Locate the AJP connector entry and change it from:

   <!-- Define an AJP 1.3 Connector on port 8009 -->
   <Connector URIEncoding="UTF-8" port="8009" protocol="AJP/1.3"
   redirectPort="8443" />

   To this:

   <!-- Define an AJP 1.3 Connector on port 8009 -->
   <Connector URIEncoding="UTF-8" port="8009" protocol="AJP/1.3"
enableLookups="false" tomcatAuthentication="false"
   redirectPort="8443" />

Enable Preauthenticated Processing Filter

These steps will help you enable preAuthenticatedProcessingFilter:

1. Locate the following file: \pentaho-server\pentaho-solutions\system\applicationContext-spring-security.xml
2. Locate the filterChainProxy and replace the patterns using this text:
<sec:filter-chain pattern="/api/repos/dashboards/print"

© Hitachi Vantara Corporation 2017. All Rights Reserved
Configure Authentication Manager

Follow these steps to configure `authenticationManager`:

1. **Locate the following file:** \pentaho-server\pentaho-solutions\system\applicationContext-spring-security.xml
2. **Replace the following `authenticationManager`:**

   ```xml
   <bean id="authenticationManager"
        class="org.springframework.security.authentication.ProviderManager">
       <constructor-arg>
         <util:list>
         <pen:bean
           class="org.springframework.security.authentication.AuthenticationProvider"/>
         <ref bean="anonymousAuthenticationProvider" />
         </util:list>
       </constructor-arg>
       <property name="authenticationEventPublisher">
         <ref bean="defaultAuthenticationEventPublisher" />
       </property>
   </bean>
   ```

3. **Add the following `authenticationManager`:**

   ```xml
   <!-- ================ AUTHENTICATION ======================= -->
   <bean id="authenticationManager"
        class="org.springframework.security.authentication.ProviderManager">
       <constructor-arg>
         <util:list>
         <ref bean="preAuthAuthenticationProvider" />
         <ref bean="anonymousAuthenticationProvider"/>
         </util:list>
       </constructor-arg>
       <property name="authenticationEventPublisher">
         <ref bean="defaultAuthenticationEventPublisher"/>
       </property>
   </bean>
   ```
Configure Preauthenticated Processing Filter

In the same file, add the following bean for `preAuthenticatedProcessingFilter`:

```xml
<!-- IWA -->
<bean id="preAuthenticatedProcessingFilter"
    class="org.pentaho.platform.web.http.security.UsernameSubstringPreAuthenticatedProcessingFilter">
    <property name="authenticationManager">
      <ref bean="authenticationManager"/>
    </property>
    <property name="regex" value=".+\(.+\)/">
  </bean>
```

Configure Preauthentication Provider

In the same file, add the following bean for `preAuthAuthenticationProvider`, just below the `preAuthenticationProcessingFilter`:

```xml
<bean id="preAuthAuthenticationProvider"
    class="org.springframework.security.web.authentication.preauth.PreAuthenticatedAuthenticationProvider">
  <property name="preAuthenticatedUserDetailsService">
    <bean id="userDetailsServiceWrapper"
        class="org.springframework.security.core.userdetails.UserDetailsByNameServiceWrapper">
      <property name="userDetailsService">
        <ref bean="ldapUserDetailsService"/>
      </property>
    </bean>
  </property>
</bean>
```
Configure Exception Translation Filter

Here are the steps for configuring `exceptionTranslationFilter`:

1. Locate the following file: `\pentaho-server\pentaho-solutions\system\applicationContext-spring-security.xml`
2. Locate the following bean: `exceptionTranslationFilter`:

```xml
<bean id="exceptionTranslationFilter"
  class="org.springframework.security.web.access.ExceptionTranslationFilter">
  <constructor-arg ref="authenticationProcessingFilterEntryPoint"/>
  <property name="accessDeniedHandler">
    <bean
      class="org.springframework.security.web.access.AccessDeniedHandlerImpl" />
  </property>
</bean>
```

3. Replace it with the following bean declaration:

```xml
<bean id="exceptionTranslationFilter"
  class="org.springframework.security.web.access.ExceptionTranslationFilter">
  <constructor-arg ref="preAuthenticatedProcessingFilterEntryPoint" />
  <property name="accessDeniedHandler">
    <bean
      class="org.springframework.security.web.access.AccessDeniedHandlerImpl" />
  </property>
</bean>
```

4. Add the following bean, below the `exceptionTranslationFilter`:

```xml
<bean id="preAuthenticatedProcessingFilterEntryPoint"
  class="org.springframework.security.web.authentication.Http403ForbiddenEntryPoint" />
```
Configure Exception Translation Filter for WS

These steps will help you configure exceptionTranslationFilterForWS:

1. Locate the following bean:

```xml
<bean id="exceptionTranslationFilterForWS"
     class="org.springframework.security.web.access.ExceptionTranslationFilter">
   <constructor-arg ref="basicProcessingFilterEntryPoint"/>
   <property name="accessDeniedHandler">
     <bean
class="org.springframework.security.web.access.AccessDeniedHandlerImpl" />
   </property>
</bean>
```

2. Replace it with the following bean:

```xml
<bean id="exceptionTranslationFilterForWS"
     class="org.springframework.security.web.access.ExceptionTranslationFilter">
   <constructor-arg ref="preAuthenticatedProcessingFilterEntryPoint"/>
   <property name="accessDeniedHandler">
     <bean
class="org.springframework.security.web.access.AccessDeniedHandlerImpl" />
   </property>
</bean>
```

3. Save your changes.
4. Restart Pentaho Server.
5. Test the changes. You should be able to log into the URL served by IIS. Go to Internet Explorer and type the following URL: http://localhost/pentaho/.
